ABSTRACT

A system, product and method for assisting an individual to analyze a domain-specific parameter, such as a company's security. In a client-server computing environment, the server computer executes computer program instructions to (1) receive from the client computer an identification of a parameter to be analyzed, (2) obtain from a data source a current value for the parameter, and (3) provide to the user computer an evaluation of the current value and an explanation of a possible significance of that evaluation.
